Research Scholar
Presents:

Cultural Diversity and Economic Performance: The Role of Trust

The talk will discuss the relationship between cultural diversity and economic performance in 78 different regions of 12 European countries. The findings indicate that it is not the size of cultural diversity that is important, but the variety of it being positively with economic performance. Furthermore, the empirical results show that both generalized trust and individuals’ trust in institutions significantly moderate the relationship between cultural diversity and economic performance in European regions.
